

NEW JERSEY STATEWIDE SURVEILLANCE

Week 22 Report for 24 May to 01 June, 2004

Submitted by Lisa Reed and Wayne Crans
Mosquito Research and Control Unit
Rutgers University, New Brunswick, NJ 08901

Purpose: Data from 84 New Jersey light traps contributed by county mosquito control agencies are used to calculate trends in mosquito populations for species of nuisance or health concerns.

Calculations are based on regional distributions, with emphasis on mosquito habitat and land use. Trends will allow a statewide evaluation of changing mosquito populations, in response to control and/or changes in habitat.

This is New Jersey Agricultural Experiment Station publication No. PT-08-40500-24-04 supported by Hatch funds and funding from the NJ State Mosquito Control Commission. Prepared by Lisa M. Reed and Wayne J. Crans.

Figure 1b. Trap lat-long locations.

Summary table

	<i>Aedes vexans</i>		<i>Culex complex</i>		<i>Coquillettidia perturbans</i>		<i>Ochlerotatus sollicitans</i>	
Region	This Week	Average*	This Week	Average*	This Week	Average*	This Week	Average*
Agricultural	0.38	0.49	0.29	5.98	0.05	0	0.40	0.07
Coastal	0.21	0.45	0.02	1.98	0	0	0.27	1.00
Delaware Bayshore	1.00	0.31	3.50	0.71	0	0	3.81	0.12
Delaware River Basin	1.21	4.39	0.04	2.94	0	0	0	0.03
New York Metro	0.33	0.97	0.23	2.58	0	0	0	0.01
North Central Rural	0	0	0	0.38	0	0	0	0
Northwest Rural	0.21	0.63	0	1.58	0	0.05	0	0
Philadelphia Metro	0	1.20	0	4.63	0	0.01	0	0
Pinelands	0.27	0.33	0.42	1.22	0.01	0.01	0	0.03
Suburban Corridor	0.19	0.98	0.02	3.11	0	0	0	0

- Complete data not yet available.

Please Note: Historical data is being entered and not yet complete. These values and graphics will change as more data is entered.

Additional Species, including *Cs. melanura*: Early season species - *Oc. canadensis*, *Oc. sticticus*, *Oc. stimulans*, and , *Ae. cinereus*

Please note: The dataset for the current year is incomplete as only 8 counties have submitted data. Interpretations must proceed with caution.

Aedes vexans - Fresh Floodwater Species

Culex Complex - Multivoltine Culex Species

Agricultural <i>Culex</i> Mix 	Coastal <i>Culex</i> Mix 	Delaware Bayshore <i>Culex</i> Mix 	Delaware River Basin <i>Culex</i> Mix 
New York Metro <i>Culex</i> Mix 	North Central Rural <i>Culex</i> Mix 	Northwestern Rural <i>Culex</i> Mix 	Philadelphia Metro <i>Culex</i> Mix 
Pinelands <i>Culex</i> Mix 	Suburban Corridor <i>Culex</i> Mix 	Comments Members of the <i>Culex</i> Complex overwinter as mated females and do not enter light traps until nighttime temperatures reach 60° F or higher. Adult populations typically build in numbers as the season progresses. Highest historical populations have been found in the Delaware Bayshore region, and likely reflect <i>Culex salinarius</i>. Inland populations, such as the Agricultural region, are usually composed of a mixture of <i>Culex pipiens</i> and <i>Culex resturans</i>, with lesser numbers of <i>Culex salinarius</i>.	

Coquilleltidia perturbans - Unique Life Cycle

Agricultural <i>Coquilleltidia perturbans</i>	Coastal <i>Coquilleltidia perturbans</i>	Delaware Bayshore <i>Coquilleltidia perturbans</i>	Delaware River Basin <i>Coquilleltidia perturbans</i>
New York Metro <i>Coquilleltidia perturbans</i>	North Central Rural <i>Coquilleltidia perturbans</i>	Northwestern Rural <i>Coquilleltidia perturbans</i>	Philadelphia Metro <i>Coquilleltidia perturbans</i>
Pinelands <i>Coquilleltidia perturbans</i>	Suburban Corridor <i>Coquilleltidia perturbans</i>	Comments <i>Coquilleltidia perturbans</i> overwinters as 2nd, 3rd, or 4th-stage larvae. This results in distinct emergences as cohorts develop through the season. Historical data suggests that the Delaware Bayshore region produces abundant numbers, but a well-placed trap in the suburban corridor reflected unusually high densities in 2003. Since the larvae typically overwinter in the 4th stage, the June emergence is usually the largest.	

Ochlerotatus sollicitans - Salt Marsh Floodwater Species

Agricultural	Coastal	Delaware Bayshore	Delaware River Basin
<i>Ochlerotatus sollicitans</i> 	<i>Ochlerotatus sollicitans</i> 	<i>Ochlerotatus sollicitans</i> 	<i>Ochlerotatus sollicitans</i> 
New York Metro	North Central Rural	Northwestern Rural	Philadelphia Metro
<i>Ochlerotatus sollicitans</i> 	<i>Ochlerotatus sollicitans</i> 	<i>Ochlerotatus sollicitans</i> 	<i>Ochlerotatus sollicitans</i> 
Pinelands	Suburban Corridor	Comments	
<i>Ochlerotatus sollicitans</i> 	<i>Ochlerotatus sollicitans</i> 	<i>Ochlerotatus sollicitans</i> is a saltmarsh species that relies on lunar tides to hatch eggs that are deposited on elevated marsh. Since lunar tides occur every two weeks, light traps sample overlapping broods. Historical data clearly reflect this trend, with largest populations occurring in the Coastal and Bayshore regions.	

Culiseta melanura - Miscellaneous Group

Agricultural <i>Culiseta melanura</i> 	Coastal <i>Culiseta melanura</i> 	Delaware Bayshore <i>Culiseta melanura</i> 	Delaware River Basin <i>Culiseta melanura</i> 
New York Metro <i>Culiseta melanura</i> 	North Central Rural <i>Culiseta melanura</i> 	Northwestern Rural <i>Culiseta melanura</i> 	Philadelphia Metro <i>Culiseta melanura</i> 
Pinelands <i>Culiseta melanura</i> 	Suburban Corridor <i>Culiseta melanura</i> 	Comments <i>Culiseta melanura</i> is the species that maintains the EEE cycle through its preferred avian bloodfeeding behavior. Larval habitat is most abundant in acidic environments, such as cedar swamps crypts. Within these habitats, populations are expected to build and peak throughout the season as overwintering instars develop and emerge. Early vector surveillance with resting boxes on southern New Jersey populations signaled a significant EEE year in 2003.	

Ochlerotatus canadensis Early Season Species

Agricultural <i>Ochlerotatus canadensis</i> 	Coastal <i>Ochlerotatus canadensis</i> 	Delaware Bayshore <i>Ochlerotatus canadensis</i> 	Delaware River Basin <i>Ochlerotatus canadensis</i> 
New York Metro <i>Ochlerotatus canadensis</i> 	North Central Rural <i>Ochlerotatus canadensis</i> 	Northwestern Rural <i>Ochlerotatus canadensis</i> 	Philadelphia Metro <i>Ochlerotatus canadensis</i> 
Pinelands <i>Ochlerotatus canadensis</i> 	Suburban Corridor <i>Ochlerotatus canadensis</i> 	Comments <i>Oc. canadensis</i> is an early-season mosquito that may re-appear later in the year. Historical data reflect May/June abundance with minor populations during the month of September.	

Ochlerotatus sticticus - Early Season Species

Agricultural <i>Ochlerotatus sticticus</i> 	Coastal <i>Ochlerotatus sticticus</i> 	Delaware Bayshore <i>Ochlerotatus sticticus</i> 	Delaware River Basin <i>Ochlerotatus sticticus</i> 
New York Metro <i>Ochlerotatus sticticus</i> 	North Central Rural <i>Ochlerotatus sticticus</i> 	Northwestern Rural <i>Ochlerotatus sticticus</i> 	Philadelphia Metro <i>Ochlerotatus sticticus</i> 
Pinelands <i>Ochlerotatus sticticus</i> 	Suburban Corridor <i>Ochlerotatus sticticus</i> 	Comments <i>Oc. sticticus</i> is a floodwater species with a life cycle similar to that of <i>Oc. canadensis</i>. Historical data indicates a May/June emergence in most areas followed by low numbers later in the season. This year's dataset shows a significant emergence in the Northwestern Rural region, well ahead of the usual trends for this species.	

Ochlerotatus stimulans - Early Season Species

Agricultural	Coastal	Delaware Bayshore	Delaware River Basin
<i>Ochlerotatus stimulans</i> 	<i>Ochlerotatus stimulans</i> 	<i>Ochlerotatus stimulans</i> 	<i>Ochlerotatus stimulans</i> 
New York Metro	North Central Rural	Northwestern Rural	Philadelphia Metro
<i>Ochlerotatus stimulans</i> 	<i>Ochlerotatus stimulans</i> 	<i>Ochlerotatus stimulans</i> 	<i>Ochlerotatus stimulans</i> 
Pinelands	Suburban Corridor	Comments	
<i>Ochlerotatus stimulans</i> 	<i>Ochlerotatus stimulans</i> 	<i>Oc. stimulans</i> is a univoltine woodland pool species with adults that persistent well into the summer. Historical data from the Northwestern Rural region show the typical trend. As with <i>Oc. sticticus</i>, this species emerged far earlier and in large numbers in the Northwestern Rural region than expected by indications of historical records.	

Aedes cinereus - Early Season Species

Agricultural	Coastal	Delaware Bayshore	Delaware River Basin
<i>Aedes cinereus</i> 	<i>Aedes cinereus</i> 	<i>Aedes cinereus</i> 	<i>Aedes cinereus</i> 
New York Metro	North Central Rural	Northwestern Rural	Philadelphia Metro
<i>Aedes cinereus</i> 	<i>Aedes cinereus</i> 	<i>Aedes cinereus</i> 	<i>Aedes cinereus</i> 
Pinelands	Suburban Corridor	Comments	
<i>Aedes cinereus</i> 	<i>Aedes cinereus</i> 	<i>Aedes cinereus</i> is the third univoltine species that may re-appear later in the season. Historical data show a spring brood (the Coastal region), a fall brood (the Delaware Bayshore region) and the typical two emergences in the North Central Rural, Northwestern Rural, and Suburban Corridor regions.
