

# VECTOR SURVEILLANCE IN NEW JERSEY

EEE, WNV, SLE, LAC, DENV, CHIK and ZIKV

Prepared by Lisa M. Reed and Dina Fonseca

Center for Vector Biology, Rutgers University

CDC WEEK 41: 8 October to 14 October, 2017

This New Jersey Agricultural Experiment Station report is supported by Rutgers University, Hatch funds, funding from the NJ State Mosquito Control Commission and with the participation of the Department of Health, Department of Agriculture and of the 21 county mosquito control agencies of New Jersey.

## *Culiseta melanura* and Eastern Equine Encephalitis

SITE/Boxes	Inland or Coastal	Historic Population Mean	Current Weekly Mean	Total Tested* (Collected)	Total Pools Tested* (Submitted)	EEE Isolation Pools	MFIR
Bass River (Burlington Co.)/5	Coastal	0.74	0.00	44	8		
Green Bank (Burlington Co.)/25	Coastal	1.00	0.00	186	12		
Corbin City (Atlantic Co.)/25	Coastal	0.53	0.00	345	18	1	2.90
Dennisville (Cape May Co.)/50	Coastal	1.20	0.10	154	14

Centerton (Salem Co.)/50	Inland	1.46	0.80	831	28	5	4.81
Turkey Swamp (Monmouth Co.)/50	Inland	0.29	0.12	235 (241)	17 (18)	1	4.26
Glassboro (Gloucester Co.)/50	Inland	0.14	0.02	211	18	1	4.74

\*Current week (in parentheses) results pending. ‡ corrected from previous week NC=no collection

**Remarks:** A total of eighteen positive EEE pools have been detected, all in *Culiseta melanura*. The latest positive pools were found at a traditional resting box site. A total of three horses has been reported infected with EEE. NOTE: Despite impending cooler weather, due diligence is required as *Culiseta melanura* is a cold tolerant species and will be active late into the season.

Statewide, 8,275 *Cs. melanura* from 636 pools have been tested, with eighteen positive pools detected for an overall *Cs. melanura* MFIR of 2.175. 14,546 specimens from 21 other species have also been tested, with no positives detected. Overall MFIR for all species statewide is 0.789.

**Traditional Resting Box Sites:** 3,009 *Cs. melanura* from 149 pools have been tested for EEE, with 41 additional *Cs. melanura* from 4 pools to be tested. One additional positive pool of *Cs. melanura* from Centerton (10 Oct) was detected. Eight positive pools were previously detected at the traditional resting box sites.

County	Trap types*	Additional <i>Cs. melanura</i> trapped by counties			
		Pools	Mosquitoes	Positives	MFIR
Atlantic	GR, LT, RB	47	977	2	2.05
Burlington	CO <sub>2</sub> , UVLT	71	2045	3	1.47

<b>TOTAL</b>		<b>487</b>	<b>5266</b>	<b>9</b>	<b>1.71</b>

**Additional County-set *Cs. melanura*:** Counties maintain trap sites for *Cs. melanura* in other areas, using a variety of traps. No new positives were collected this week. Previously, nine positive pools were collected from these county-set sites.

**Horses and Humans:** There have been three horses with EEE infections. The last horse reported, in Cumberland County, had onset of symptoms on 30 September and euthanized the same day. There was no vaccination history. The second horse was a 9 yo mare with date of onset 17 September and no vaccination history for 2017, but reportedly vaccinated two years ago. The first horse case was a 5 yo mare from Cumberland County, with onset date of 23 Aug, euthanized on 28 Aug. There was no vaccination history. Nearly all of the horse cases from previous years include those horses who were either not vaccinated or had incomplete vaccination histories. **Horse owners are urged to make sure their horses are up to date on their vaccinations. Horse cases are known to occur through October and sometimes into November (see link below).** Other sensitive species are non-native birds, such as Ostriches/Emus and Gallinaceous birds such as pheasants of Eurasian origins.

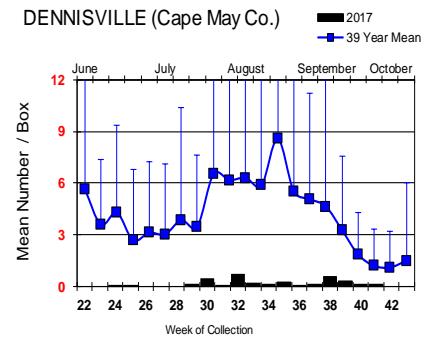

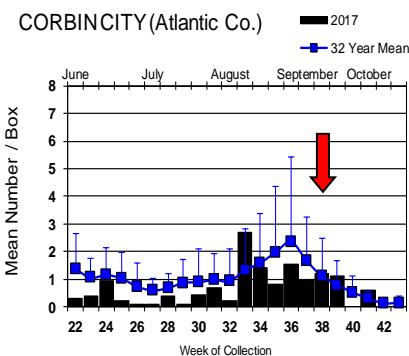

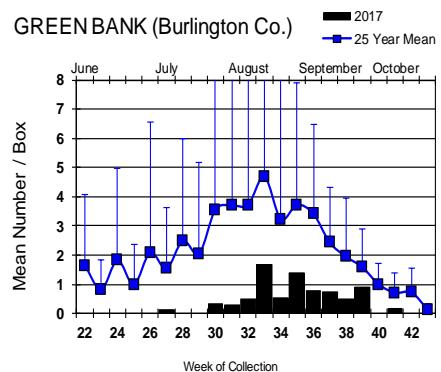

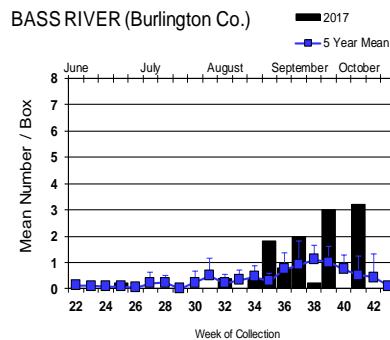

**Horses and Vaccinations:** The fate of unvaccinated equids reinforces the necessity of maintaining a vaccination schedule for arboviruses. For vaccination schedules recommended by the American Association of Equine Practices, see: [http://www.aaep.org/vaccination\\_guidelines.htm](http://www.aaep.org/vaccination_guidelines.htm)

**Additional Species:** Twenty-one additional species were tested for EEE. No additional positives were detected. Previously reported *Aedes provocans* was re-assigned to *Anopheles punctipennis*.

# Culiseta melanura Population Graphs

## Coastal

## Inland

One additional pool of EEE positive Cs. melanura at the traditional resting box sites was detected at the Centerton site, collected 10 October. Eight previous detections of EEE had occurred at Centerton, Corbin City, Turkey Swamp, Winslow and Glassboro. Mosquito populations for the most part declined at the sites, with the exception at Bass River, where another significantly high abundance over historical data was collected. Positive pools continue to be in the southern half of the state.

= Positive pool(s) detected (red = melanura, purple = other species).

**EEE in US** (2017 cumulative cases): (Black or Red = previous + new reported cases occurring)

- equine: FL(5/1 deer) GA(5) LA(2) MI(6) NC(1) NJ(3) **NY(1)** OH(1) SC(8) TX(1) WI(21)

<i>Psorophora ferox</i>	20	293		
<i>Uranotaenia sapphirina</i>	4	38		
<b>Grand Total</b>	<b>8834</b>	<b>169796</b>	<b>826</b>	<b>4.865</b>

**Remarks:** To date, 8,834 pools of 169,796 mosquitoes from 35 species have been tested. 826 positive pools have been detected. Most continue to be in the enzootic vector, *Culex* (Mix, *pipiens* or *restuans*). Overall MFIR for New Jersey is at 4.865, down from 4.889 of last week. Activity level is approaching 2010 levels (see graph below). First positive *Culex* Mix pool was detected in Sussex County on 12 June. Last year, the first positive pool of *Culex* Mix was collected on 14 June in Monmouth County.

**Humans, Horses and Wild Birds:** Five human cases of WNV have been detected: Atlantic (1), Mercer (2) Gloucester (1) and Monmouth (1). (A previous case in Atlantic County has been re-assigned to a different state as the person developed

symptoms a day after arriving in NJ.) Previously, two horse cases have been detected. The second horse, from Salem County, had an onset of symptoms date 29 September. There was no vaccination history, but the horse is, at this date, still alive. The first presumptive horse case was in Gloucester County, a 1 yo colt with symptom onset date of 24 September. An initial dose of 3 vaccinations was reported. This horse too is still reported alive at this date. Last year, human cases were first reported in CDC week 20, but under unusual circumstances. First typical case occurred in CDC week 27. For further information, see <http://www.nj.gov/health/cd/statistics/arboviral-stats/> .

Birds are no longer routinely tested in New Jersey.

Above is a graph showing cumulative number of positive pools for the last 9 years, inclusive of the most active (2012) and least active (2009) years. As the season peaks, the cumulative increase for 2017 is showing a definite increase in activity (black markers with pink borders). It will be a race to the end of the season to see if 2017 hits the activity level of 2010.

### WNV Results by County through 13 October 2017.

## Saint Louis Encephalitis (SLE) to 13 October 2017.

New Jersey will be primarily testing for SLE this year only when adjacent states show human activity (Cape May tests mosquitoes in the Cape May lab independently). SLE has had previous activity in New Jersey, most notably in 1964 and 1975 (CDC's SLE [website](#)), the latter prompting the surveillance reporting by Rutgers. SLE is a flavivirus and has a similar transmission pattern to West Nile, with *Culex* species as the predominant vectors.

No pools of SLE have tested positive for 2017. No human cases have been reported.

County	Species	Pools	Mosquitoes	Positives	MFIR
<b>Burlington</b>		<b>20</b>	<b>1042</b>		
	<i>Culex</i> spp.	20	1042		
<b>Cape May</b>		<b>765</b>	<b>7069</b>		
	<i>Culex pipiens</i>	735	7007		
	<i>Culex</i> spp.	30	62		
<b>Grand Total</b>		<b>785</b>	<b>8111</b>		

## La Crosse Encephalitis (LAC) to 13 October 2017.

New Jersey will be primarily testing for LAC this year only when adjacent states show human activity (Cape May tests mosquitoes in the Cape May lab independently). New Jersey has had 3 cases of this encephalitic disease since 1964 (see CDC's LAC [website](#)). The mortality is low but like other encephalitides, LAC can have both personal (lasting neurological sequelae) and economic impacts. LAC is a bunyavirus with a transmission cycle involving mosquitoes such as *Aedes triseriatus* and small mammals such as squirrels and chipmunks. LAC can not only infect *Aedes albopictus* but transovarial transmission was also demonstrated. (Tesh and Gubler 1975 Laboratory studies of transovarial transmission of La Crosse and other arboviruses by *Aedes albopictus* and *Culex fatigans*. American Journal of Tropical Medicine and Hygiene 24(5):876-880).

No pools of SLE have tested positive for 2017. No human cases have been reported.

County	Species		Positives	MFIR
<b>Burlington</b>		<b>17</b>	<b>304</b>

## Dengue (DENV) to 13 October 2017.

New Jersey will be selectively testing for DENV (including serotypes) this year. Dengue has not had a history of local transmission here in New Jersey, but each year, travelers can bring virus back from areas in the world with virus activity. This is significant as humans are NOT dead-end hosts and thus there is the potential for local transmission (i.e., New Jersey mosquitoes biting a sick person and then biting and transmitting the disease to someone else) to be established. DENV is a flavivirus but unlike WNV, *Aedes* mosquitoes are predominant vectors. In New Jersey, *Aedes albopictus* is a candidate for local transmission. There are 4 serotypes tested for Dengue.

\*Note\* Same pools of *Ae. albopictus* are tested for the four serotypes of Dengue as well as Chikungunya.

No pools of Dengue have tested positive in 2017. There are 6 travel-related human cases in NJ.

County	Species	DENV1		DENV2		DENV3		DENV4		Pos.	MFIR
		Pool	Mos.	Pool	Mos.	Pool	Mos.	Pool	Mos.		
<b>Mercer</b>		<b>13</b>	<b>156</b>	<b>13</b>	<b>156</b>	<b>13</b>	<b>156</b>	<b>13</b>	<b>156</b>

<b>Grand Total</b>		<b>14</b>	<b>176</b>	<b>14</b>	<b>176</b>	<b>14</b>	<b>176</b>	<b>14</b>	<b>176</b>		

## Chikungunya (CHIK) to 13 October 2017.

New Jersey will be selectively testing for CHIK this year. Chikungunya is similar in symptoms to Dengue, a "breakbone" fever and has a low mortality rate. But this virus has had recent worldwide activity, and in the past year has come to the Western Hemisphere. As with Dengue, transmission can occur when a mosquito bites an infected human, then bites an uninfected human who subsequently becomes ill. CHIK is an alphavirus with *Aedes* mosquitoes as potential vectors. In New Jersey, *Aedes albopictus* is the mosquito of interest.

No pools of CHIK have tested positive in 2017. There are 6 travel-related human cases in NJ.

County	Species	Pools	Mosquitoes	Positives	MFIR
<b>Cape May</b>		<b>434</b>	<b>1184</b>		
	<i>Aedes albopictus</i>	434	1184		
<b>Mercer</b>		<b>13</b>	<b>156</b>

<b>Middlesex</b>		<b>1</b>	<b>20</b>		
	<i>Aedes albopictus</i>	1	20		
<b>Grand Total</b>		<b>448</b>	<b>1360</b>		

## Zika (ZIKV) to 13 October 2017.

New Jersey will be selectively testing for ZIKV this year. Zika is an emerging arboviral threat with significant health consequences for fetuses and recent activity in the Western Hemisphere. Humans are potential hosts that can transmit through sexual activity. ZIKV is a flavivirus with *Aedes* mosquitoes as potential vectors. In New Jersey, *Aedes albopictus* is the mosquito of interest.

No pools have tested positive in 2017. There are 25 travel-related human cases in NJ.
