

ATLANTIC CITY

GREEN NEW DEAL SUPERSTUDIO

Atlantis "let the water in"

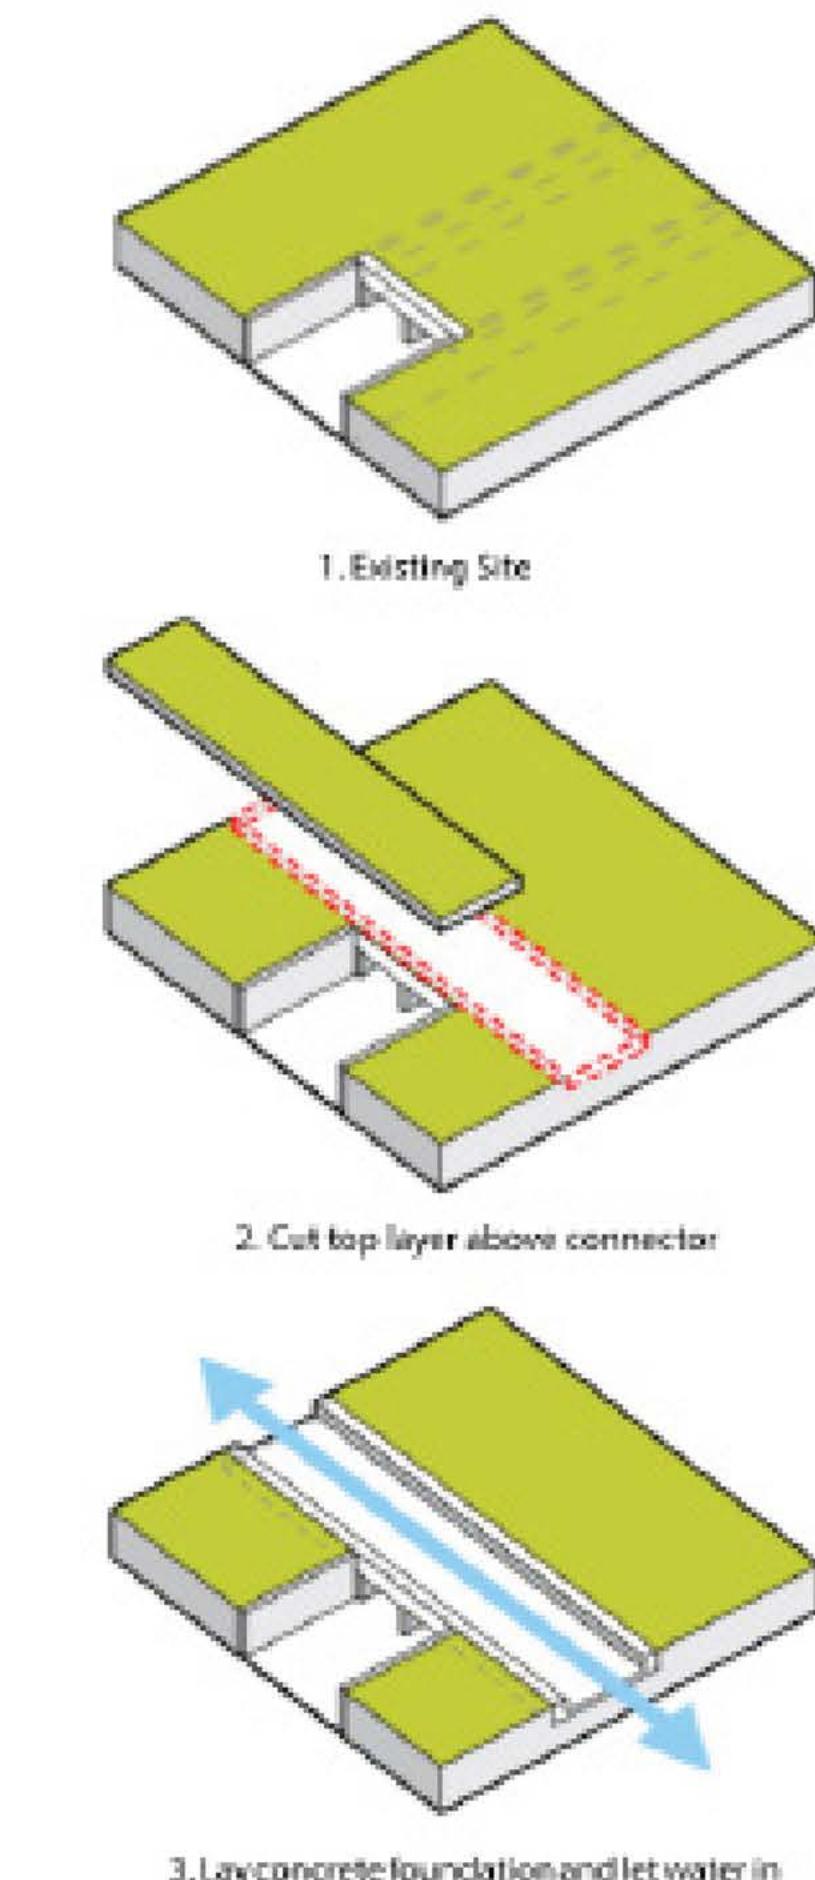

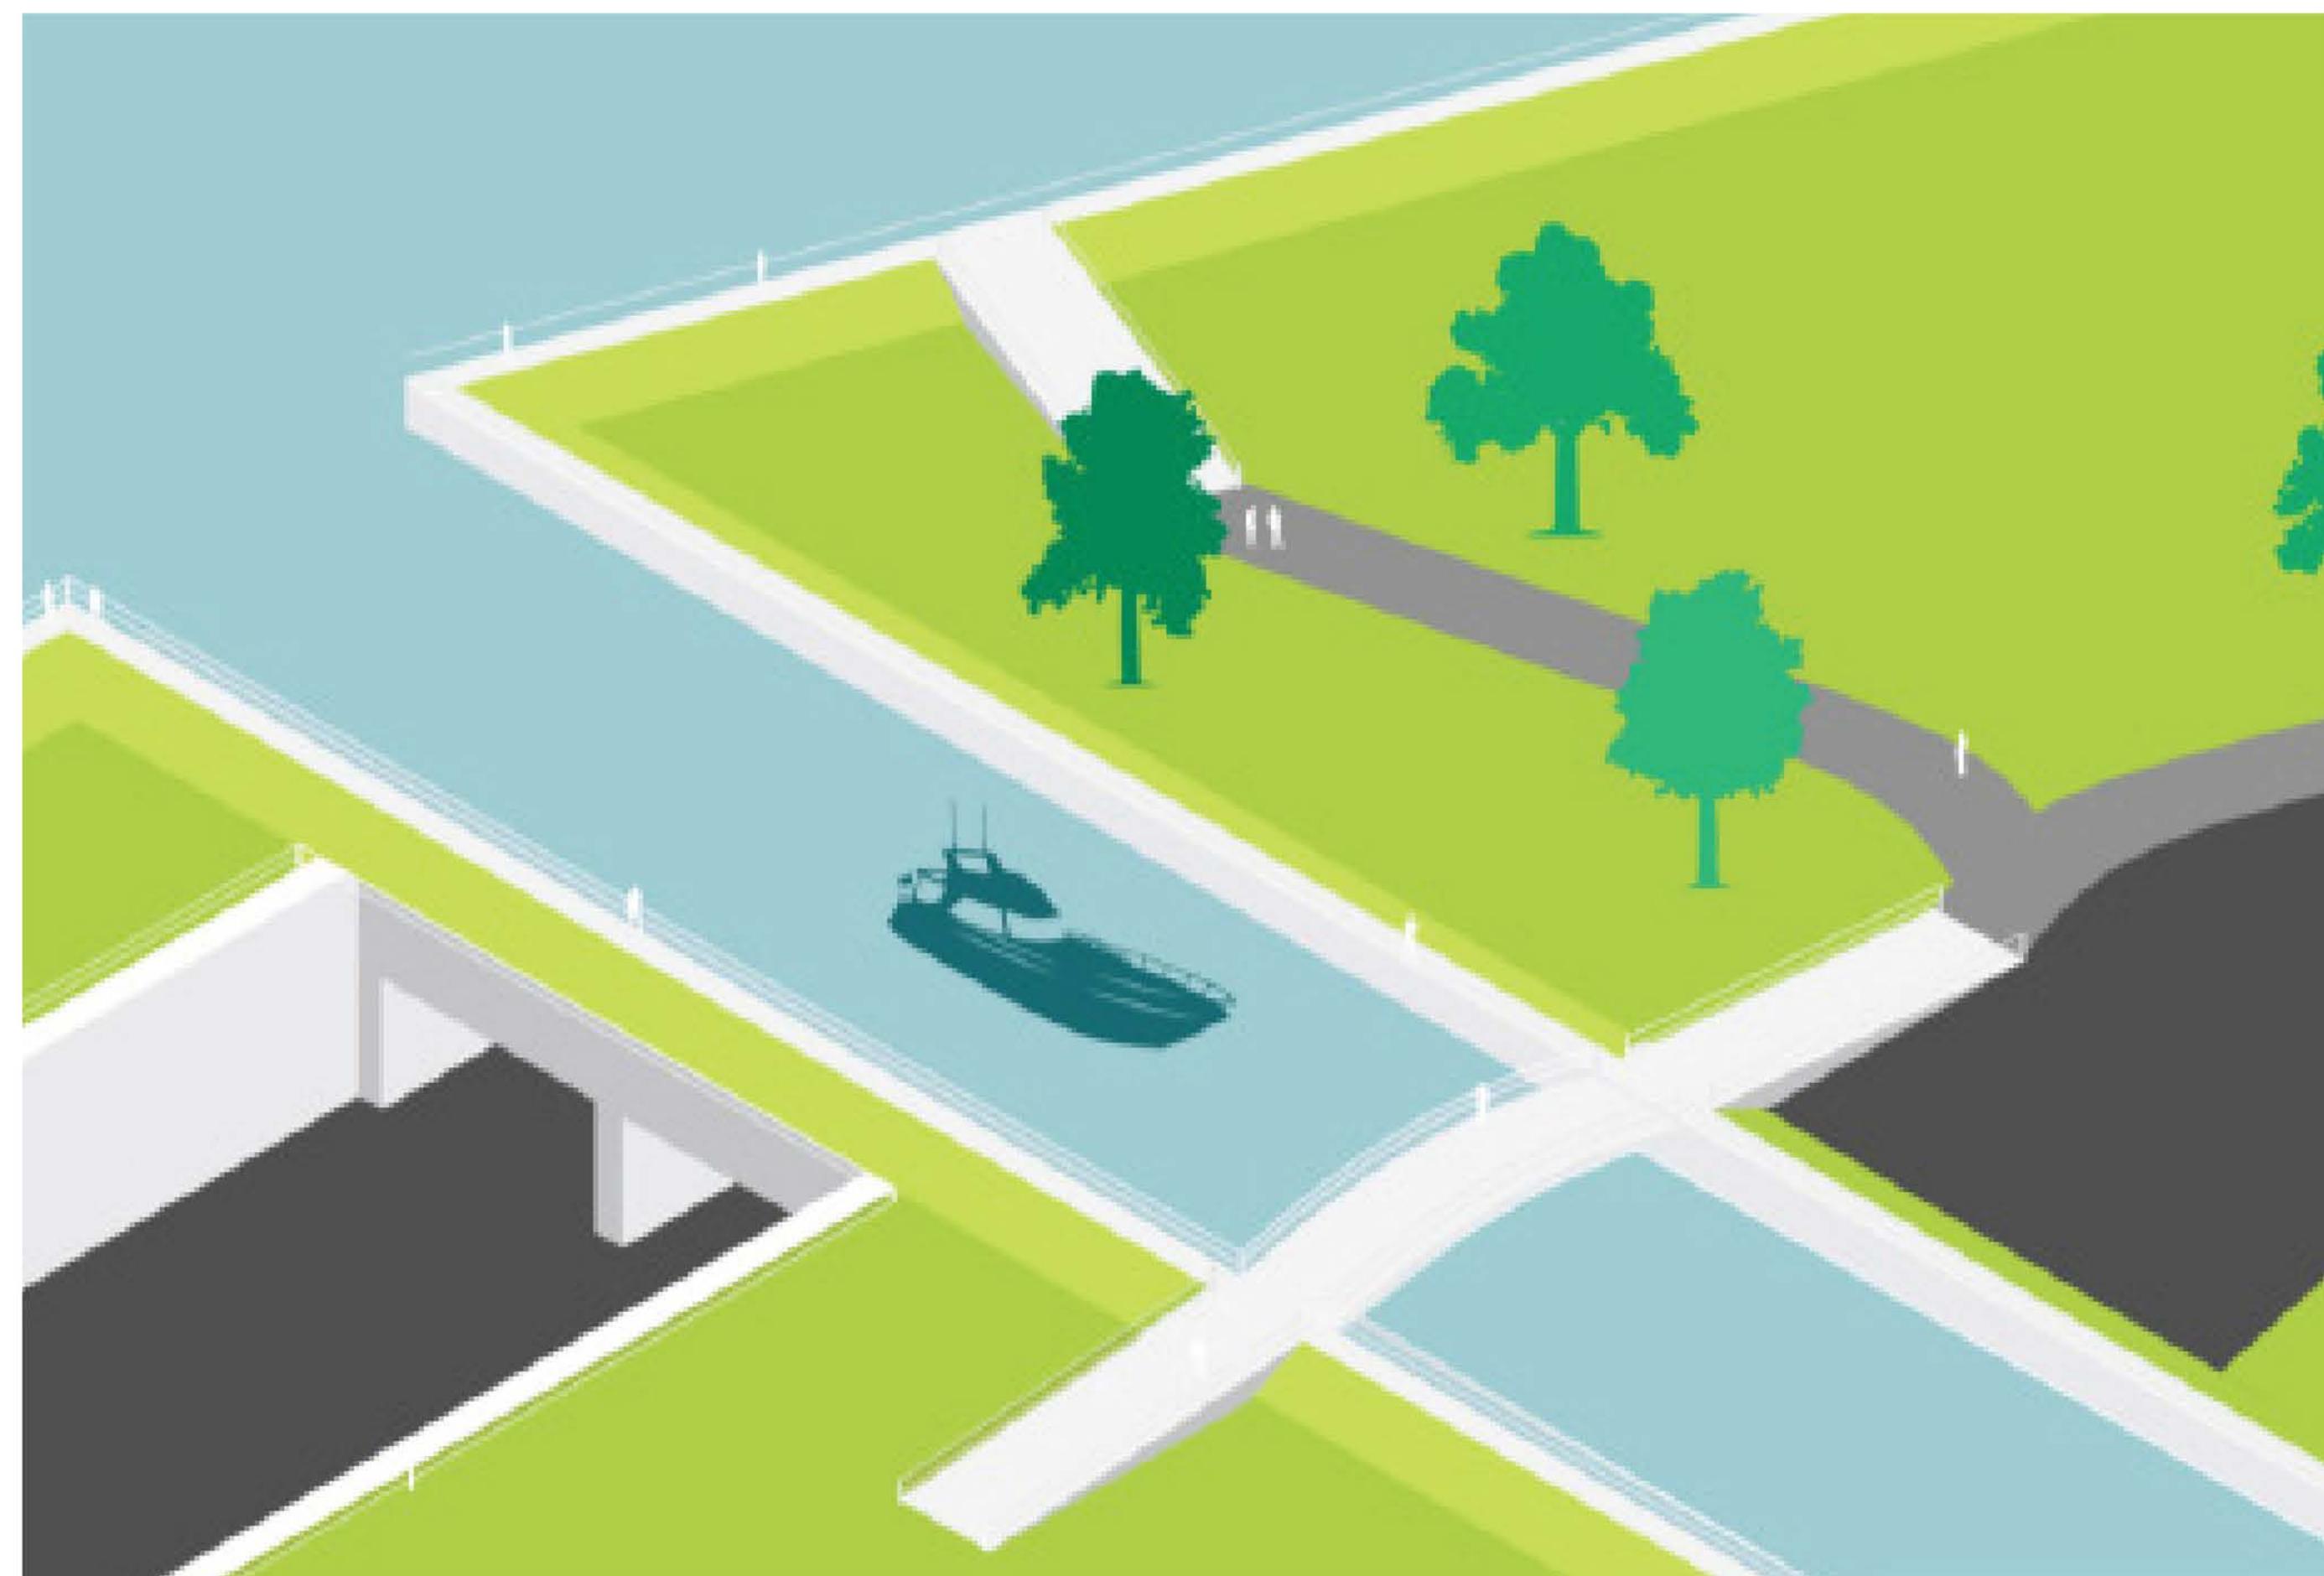

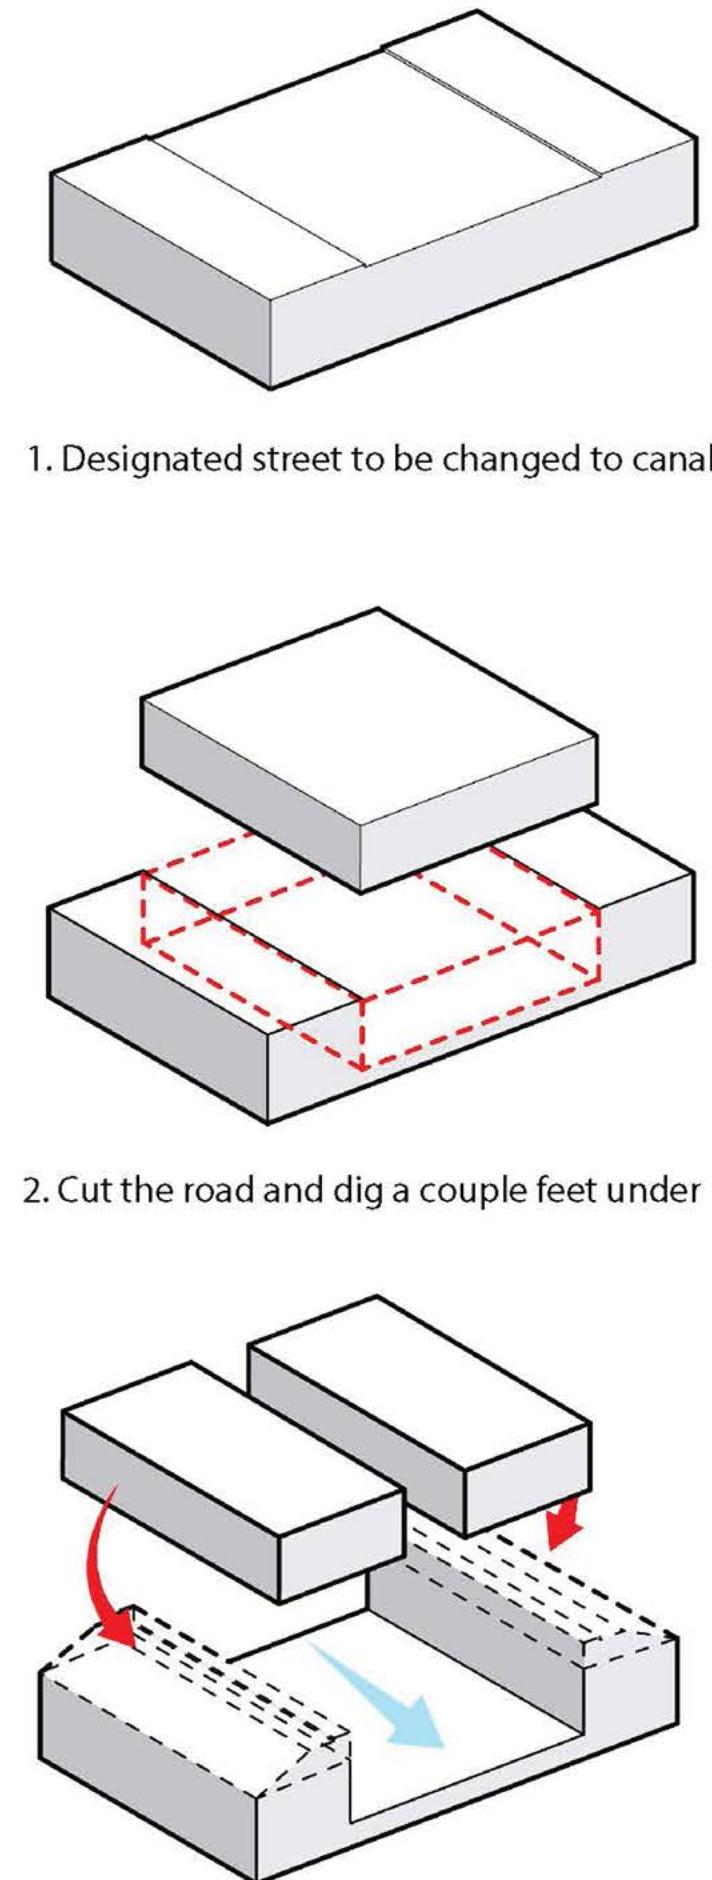

Master Plan

Our design proposal illustrates a way in which Atlantic City, New Jersey could welcome the water that comes with future sea level rise and storm surge. Through the implementation of canals, eco-system restoration, and ecotourism infrastructure we are able to create a new connected and cohesive system of circulation will encourage visitors to explore beyond the already popular coastline.

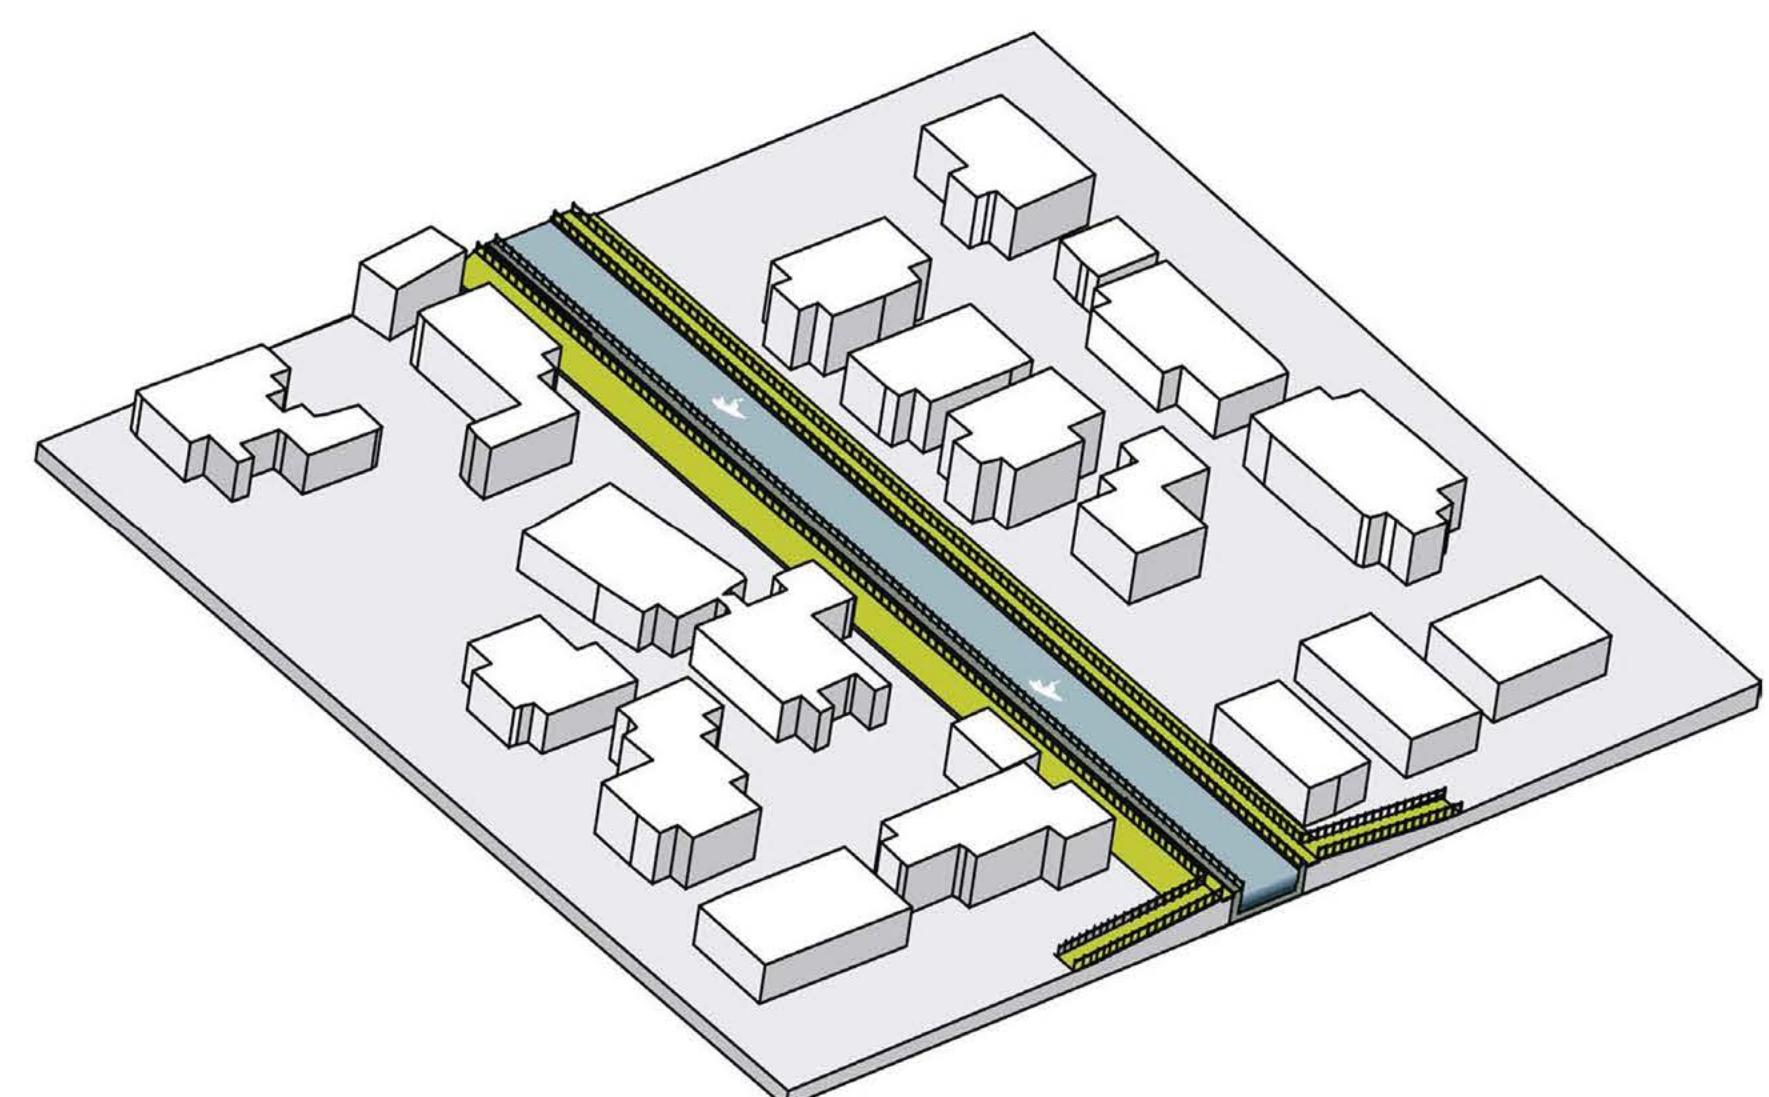

Let the Water In!

Why keep the water out with ugly sea walls when you could bring the water in through beautiful canals and berms that run though the existing streets of Atlantic city. These canals and berms provide a new and unique interactive space between the water and people. While now citizens may feel detached from the water, brining the water in and through the city allows for more connectivity to their environment.

Canals and Berms

4ft. deep canals cutting through Residential Areas.
